

Blocking best practices?

Chris Wendt

Overview

- Based on feedback Eric provided in an earlier meeting and some experience we have gotten with applying blocking based on new FCC rules around unallocated/unassigned
- Wondering if there would be interest to collaborate on best practices

911/GETS

- Encountered a few issue with PSAPs using invalid numbers for callback/ Reverse 911
- We seem to have to test all PSAPs one by one
- Publishing list of ANIs is not going to work (security issue)
- Is there a better way (other than STIR/SHAKEN to validate that the call is coming from 911)?
- GETS seems to be more straight forward there is a set of NPA for that, however is this a hole also until we get to wide support for RPH/STIR?

Blocking for no Calling party number

- Looking for opinions,
 - Would calls that do not have any calling party number qualify for “unallocated” blocking?
 - Should that be qualified by also not having any privacy indicators?
